

std::exception

```
classDiagram
    class original_unsupportedMethodError["original::unsupportedMethodError"]
    class std_exception["std::exception"]
    original_unsupportedMethodError --|> std_exception
```

The diagram illustrates an inheritance relationship. At the bottom is a gray-shaded class box for 'original::unsupportedMethodError'. It has three horizontal compartments: the top one contains the class name, and the other two are empty. Above it is a white class box for 'std::exception', also with three horizontal compartments: the top one contains the class name, and the other two are empty. A blue arrow with an open triangular head points from the top compartment of the gray box to the bottom of the white box, indicating that 'original::unsupportedMethodError' inherits from 'std::exception'.

original::unsupportedMethod
Error
