

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class original_callback_return_type_error["original::CallbackReturn\nTypeError"]
    original_callback_return_type_error --|> std_exception
```

The diagram shows a class hierarchy. At the top is a white box representing the base class 'std::exception'. It has two empty rectangular slots below its name. Below it is a gray box representing the derived class 'original::CallbackReturn TypeError'. A blue arrow with an open triangle head points from the derived class to the base class, indicating inheritance. The derived class has two additional slots: an empty one above a slot containing '+ what()'.

original::CallbackReturn  
TypeError

+

what()
