    class std_exception["std::exception"]
    class original_error["original::error"]
    class original_null_pointer_error["original::nullPointerException"]
    original_error --|> std_exception
    original_null_pointer_error --|> original_error
    original_null_pointer_error + what()
```

The diagram illustrates a hierarchy of exception classes. At the top is the `std::exception` class. Below it is the `original::error` class, which inherits from `std::exception`. At the bottom is the `original::nullPointerException` class, which inherits from `original::error`. The `original::nullPointerException` class has a public method `what()`.
