

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class original_callback_return_type_error["original::CallbackReturn\nTypeError"]
    original_callback_return_type_error --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a class box for 'std::exception', which is divided into three horizontal sections: the top section contains the class name, and the two bottom sections are empty. Below it is a class box for 'original::CallbackReturn TypeError', which is divided into three horizontal sections: the top section contains the class name, the middle section is empty, and the bottom section contains a plus sign followed by the method name 'what()'. A blue arrow with an open triangular head points from the top of the 'original::CallbackReturn TypeError' box to the bottom of the 'std::exception' box, indicating that 'original::CallbackReturn TypeError' inherits from 'std::exception'.

original::CallbackReturn  
TypeError

+

what()
