

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class original_callback_signature_error["original::CallbackSignatureError"]
    original_callback_signature_error --|> std_exception
```

The diagram illustrates an inheritance relationship. At the bottom is a grey-shaded class box for 'original::CallbackSignatureError'. It has two sections: the top section contains the class name, and the bottom section contains a public method '+ what()'. Above this is a white class box for 'std::exception', which is empty except for its name in the top section. A blue arrow with an open triangular head points from the bottom of the 'original::CallbackSignatureError' box to the bottom of the 'std::exception' box, indicating that 'original::CallbackSignatureError' inherits from 'std::exception'.

original::CallbackSignature
Error

+

what()
