

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class original_unsupportedMethodError["original::unsupportedMethodError"]
    original_unsupportedMethodError --|> std_exception
```

The diagram illustrates an inheritance relationship. At the bottom is a class box for 'original::unsupportedMethodError', which is shaded gray and contains a public method '+ what()'. Above it is a class box for 'std::exception', which is white. A blue arrow with an open triangular head points from the 'original::unsupportedMethodError' box to the 'std::exception' box, indicating that 'original::unsupportedMethodError' inherits from 'std::exception'.

original::unsupportedMethod
Error

+

what()
